

Marking up your site: Overview

At Bing, enabling users to make key decisions through visually appealing, information-rich search results is a key component of our search experience. As a content publisher, you can contribute to – and stand out in – this experience by annotating your structured content using any of the following supported specifications:

- [Schema.org](#) in the following formats:
 - [HTML Microdata](#)
 - [JSON-LD](#)
- [Microformats](#)
- [RDFa](#)
- [Open Graph](#)

Our crawlers do not prefer one specification over another. It’s entirely up to you to decide which of the supported specifications best fits your data. A basic understanding of web markup is generally sufficient to implement your annotations.

Annotating your data doesn’t actually change the visible content, but gives Bing valuable information on the type of content you’re hosting on your site. On our side, we put your annotations to good use, for example by using them to increase the visual appeal of your search results, or to supplement and validate our data sources.

For example, using address annotations, Bing may display the following search result:

[Tulio Ristorante - Seattle, WA, 98101 - Citysearch](#)
(Map) · 1100 Fifth Ave, Seattle, WA 98101
Jan 24, 2011 · (206) 792-5588 · The Scene – Dim and cozy, the small bar and adjoining restaurant are comfortable places for an after-work cocktail or pre-theater meal ...
[seattle.citysearch.com/profile/10767458](#) · [Mark as spam](#)

Citysearch
