## Executive Summary

BlueSnap, Inc. (now operating as BlueSnap powered by Payroc) is a global payment orchestration platform based in Waltham, Massachusetts that supports e-commerce, SaaS/embedded payments, and B2B accounts receivable automation. It's six person marketing team runs multi-channel campaigns across paid search, paid social, display/CTV, email, SEO/PR, content syndication, and partner/affiliate programs, and is also investing in "generative engine optimization" to improve discoverability in AI assistance, such as ChatGPT. With no separate analytics team, marketing owns attribution and must explain pipeline and revenue impact to executive leadership, Sales and Business Development.

The main problem is that Bluesnap's current information systems and attribution practices cannot reliably show which marketing activities truly drive high-quality opportunities and revenue. Core platforms (HubSpot, Salesforce, Google Ads, LinkedIn, MNTN, and others) track differently and are not fully integrated, leading to data silos and broken cross-device paths. Many paid, partner and CTV assisted journeys appear as "organic" or "direct" and HubSpot's first-touch, last-touch and U-shaped models only allocate credit within what the platform can see. To compensate, the team relies on manual workarounds, reviewing "How did you hear about us?" responses and re-classifying ChatGPT driven leads, which are time-consuming and not scalable. Limited, one-off testing (for example, CTV lift in PPC and Taboola) and executive preferences for simple, short-term metrics complicate interpretation of funnel KPIs, such as leads, net leads, MQLs, SQLs, opportunities and wins by channel.

The analysis combined a process and data flow map of the TOFU-MOFU-BOFU journey, KPI, and dashboard review, and a SWOT lens. Mapping showed where leads enter through multichannel campaigns, how they are nurtured in HubSpot and routed to Salesforce and where attribution breaks when social data does not sync cleanly. KPI review confirmed that BlueSnap has a robust funnel metric structure, but limited ability to trace those metrics back to specific channels and campaigns. The SWOT highlighted strengths (multichannel strategy, strong tools, conceptual understanding of multitouch "assists"), weaknesses (fragmented data, heuristic models, manual interpretation), opportunities (data-driven attribution, stronger, HubSpot/Salesforce integration, structured use of qualitative fields and lift test) and threats (tightening privacy, loss of detailed user-level tracking, and pressure for "silver bullet" email or channel metrics in a long B2B buying cycle).

Key findings from the research and case analysis are that BlueSnap's attribution problems are driven more by stack design and data governance, than by lack of attribution knowledge. Simple first and last-click models systematically under-credit upper-funnel, partner, and CTV channels, especially in cross-device environments. Cross-device behavior and privacy regulations create exactly the kind of data fragmentation described by the head of the marketing team. BlueSnap already has valuable qualitative and test-based evidence, but has not organized them into a

formal measurement system. Organizational expectations and KPI alignment are as important as technology for building trusted, full-funnel reporting.

Given these findings, the recommended path is a phased, internally owned improvement process that builds on existing systems rather than buying a ready to use attribution platform. The recommendations are to: (1) strengthen data integration and governance so HubSpot and Salesforce function as a “virtual CDP” with standardized fields, identifiers, and UTM conventions; (2) add a simple data-driven multitouch attribution model (for example, regression on campaign-level presence across recent touchpoints) alongside existing heuristic reports; (3) formalize, qualitative attribution fields and incorporate structured options for sources, such as ChatGPT/LLMs, partners, and PR; (4) introduce a small, ongoing program of lift and incremental tests for priority channels like CTV and LinkedIn; and (5) align KPIs and dashboards with B2B realities by adding metrics for lead quality assists, and long-term value and reviewing them jointly with marketing, sales, finance and leadership. Together, these steps would turn attribution from a routine reporting task into a decision-support system that helps leaders allocate budget, defend investments in brand and partners, and grow pipeline and revenue with greater confidence.

### **Organization Overview:**

Bluesnap, Inc., is a global payment orchestration platform headquartered in Waltham, Massachusetts, operating in the fintech and payments industry. It supports online businesses across direct-to-consumer, direct-to-merchant, software and SaaS platforms with embedded payments, and B2B firms automating accounts receivable. The company was recently acquired by Payroc and now operates as “Bluesnap powered by Payroc.” Prior to the acquisition it had about 245 employees, including a six person marketing team led by Vice President of Marketing and Partner Strategy, April Grudier. In the absence of a dedicated analytics team, any marketing attribution solution must align with the existing marketing organization’s capacity and resources. April served as the primary point of contact for this case, overseeing global marketing campaigns, partner and affiliate programs, and demonstrating the impact of marketing investments on pipeline revenue to stakeholders in executive leadership, Sales and Business Development. BlueSnap’s information systems are a set of interrelated components that collect, process, store, and distribute information to support improved decision-making and competitive advantage by showing which marketing activities drive qualified pipeline and revenue.

### **Problem definition**

BlueSnap’s marketing team runs an integrated digital strategy across paid search, paid social, display/CTV, email, SEO/PR, content, syndication, and partner and affiliate programs, including “generative engine optimization” (GEO) to support discoverability in AI assistants, such as ChatGPT. (A. Grudier, personal communication, Nov 7, 2025). The team consists of six people with no separate analytics function, so marketing owns attribution while reporting results to executive leadership, sales, and business development. April reviews attribution data monthly by

vehicle and campaign and checks HubSpot “multiple times a day” to monitor leads and net leads (A. Grudier, personal communication, Nov 7, 2025). Despite this campaign mix and active monitoring, the current information systems and analytics are not capable of delivering a unified, causal view of marketing performance across platforms and devices (A. Grudier, personal communication, Nov 7, 2025).

The core IS/analytics challenges can be summarized into five related problems that reflect the interaction of organizational, technology, and people factors emphasized in Information Systems and Business Analytics (ISBA). First, there are data silos and identity and tracking gaps. April noted that the core systems such as HubSpot, Salesforce, Taboola, and other display networks, Google Ads, LinkedIn and MNTN “track differently” and “do not necessarily speak to each other, which makes it difficult to connect the dots” across the customer journey (A. Grudier, personal communication, Nov 7, 2025). As a result, Bluesnap often can’t see which touchpoints cause prospects to visit the website by direct or branded search, even when those visits appear in reporting as “organic” or “direct” (A. Grudier, personal communication, Nov 7, 2025).

Second, misclassified and incomplete attribution data mean that many paid and partner-driven touches show up as “organic” or “direct” and the current first-touch, last-touch and U-shaped models under credit assists from CTV, PR, partners, LinkedIn, or ChatGPT exposure (A. Grudier, personal communication, Nov 7, 2025). BlueSnap’s HubSpot reporting (see Appendix A) indicates use of built-in models, such as first interaction, last interaction, linear, U-shaped, and time decay at the campaign and asset level, but these are still heuristic, rule based models that split credit only within what HubSpot can see. This gap between heuristic attribution and actual influence make it difficult for the team to know how much value channels like CTV and PR truly add when they mainly act as assists (A. Grudier, personal communication, Nov 7, 2025).

Third, the team relies heavily on manual, non-scalable workarounds to compensate for system limitations. BlueSnap’s marketing team manually reviews “How did you hear about us?” fields to infer hidden channels such as ChatGPT. Although they’ve “seen an 18% increase in leads” from ChatGPT since January, HubSpot does not automatically classify ChatGPT as first or last-touch and LinkedIn’s limited API means that social engagement must be reconciled manually (A. Grudier, personal communication, Dec 3, 2025). Lead information syncs automatically between HubSpot and Salesforce, but social engagement does not, making LinkedIn a recurring bottleneck for attribution (A. Grudier, personal communication, Dec 3, 2025). These people and process workarounds are compensating for technology and data integration gaps, which is typical when information systems do not fully support managers’ decision needs and reflects the classic interaction of organizational, technology, and people issues.

Fourth, there is limited experiment-based or causal measurement. April reported that BlueSnap has run useful tests with its CTV campaigns and “saw a lift of 33% in click throughs on PPC (Pay-Per-Click)” and “higher clicks on Taboola and LinkedIn among exposed audiences” (A. Grudier, personal communication, Nov 7, 2025). However, there is no ongoing, systematic program of incrementality or lift testing across channels, and attribution results are reviewed monthly by April and the individual vehicle owners rather than by a dedicated analytics team (A. Grudier, personal communication, Dec 3, 2025).

Finally, organizational expectations and KPI alignment create pressure around how attribution information is interpreted. April noted that some executives expect a “silver bullet” such as an email that will drive responses, but she emphasizes that in B2B “95% of your target audience is not in the market” and that marketing must “prime” demand over a long cycle (A. Grudier, personal communication, Nov 7, 2025). BlueSnap’s annual goals focus on the number of leads, Sales Qualified Leads (SQLs), opportunities, and wins attributed to inbound marketing, and dashboards emphasize leads in HubSpot on a daily basis (A. Grudier, personal communication, Dec 3, 2025). The November 2025 Month-end results (see Appendix C) show a sophisticated KPI structure from leads and net leads through MQL, SQL, opportunities, wins, and Projected AGM, but attribution inaccuracies and mismatched expectations make it difficult to interpret these KPIs correctly by channel. Note that the internal slide deck shared for this case study is provided only as an example to show the types of KPIs. The numbers it contains do not represent real company results.

These problems matter because they directly affect how Bluesnap allocates marketing budget, reports customer acquisition cost (CAC) and ROI by channel, and defends investments in brand, partners, and AI discoverability. Without a unified, accurate view of the customer journey, April cannot confidently explain which touch points truly drive high-quality opportunities and revenue, weakening strategic decisions about channel mix and partner focus. Bluesnap’s current marketing information system is not fully delivering on the core business objectives of improved decision-making and competitive advantage.

## **Analysis**

This analysis examines Bluesnap’s marketing attribution challenges by first mapping the process flow across systems, then reviewing key KPIs and dashboards, and finally assessing strengths, weaknesses, opportunities and threats using a SWOT analysis.

### *Process Data Flow, KPI and Dashboard Review*

Top-of-funnel (TOFU). Bluesnap attracts Ideal Customer Profile (ICP) prospects through paid search, paid social, display and CTV video ads on streaming apps, SEO, PR, content syndication, and partner and affiliate channels. The goal at this stage is often to get visitors to provide an

email address for an e-book, report, or other educational content. Once a prospect fills a TOFU form, they enter HubSpot and “have opted to be marketed to,” which enables behavioral tracking and scoring.

**Middle-of-funnel (MOFU).** In MOFU, HubSpot nurtures leads with email sequences, case studies, and high-value pages chosen to build intent. BlueSnap uses an ICP filter based on target company profile and technologies and scores behavior such as page views and content engagement. At this stage, April monitors leads, net leads, MQLs and SQLs, which are reported month-over-month and year-over-year in standard templates (see Appendix C), with HubSpot dashboards used daily to monitor performance (see Appendix B). This reflects an information system that supports qualification and routing decisions, although attribution gaps limit how confidently these KPIs can be attributed back to specific campaigns.

**Bottom-of-funnel (BOFU).** When someone fills a “talk to sales” form, this is ideal, and the lead is routed directly to the business development team in Salesforce. At this stage, HubSpot and Salesforce share lead and opportunity data, but attribution models are still largely based on where the lead “first interacted” and “the last thing they saw before their conversion.” This sync is automatic for leads and opportunities, but not for social engagement data. For example, LinkedIn does not flow cleanly into HubSpot due to API limitations. (A. Grudier, personal communication, Dec 3, 2025). The organization, people and technology dimensions are visible here. HubSpot and Salesforce provide the technology layer, but incomplete, social integrations and manual processes, create people and organization burdens in connecting the full customer journey.

The data path cuts across Google ads, LinkedIn, MNTN and other display platforms, HubSpot forms and tracking, ZoomInfo enrichment, and Salesforce CRM. Each system logs interactions with its own IDs and tracking logic, which contributes to data silos. Bluesnap’s environment illustrates the challenge of Big Data and Analytics where data from web, email, social, partners, and TV remain spread across systems instead of being unified into a single information system.

### *SWOT Analysis*

BlueSnap strengths include a multi-channel, funnel-based strategy, strong tools (HubSpot, Salesforce, Zoominfo, major ad platforms), and a marketing leader who understands that “there are assists in getting things into the goal” and that organic and direct should not simply be dismissed (A. Grudier, personal communication, Nov 7, 2025). An example of the HubSpot Campaign report provided by April shows that multiple attribution models within HubSpot are already in use at the asset and interaction-source level, indicating conceptual awareness of multi-touch attribution (see Appendix A). This suggests that conceptual awareness of multitouch attribution exists.

Weaknesses include fragmented data, inconsistent tracking, and over reliance on heuristic attribution and manual interpretation. Many paid, partner, and CTV assisted journeys still appear as “organic” or “direct” and LinkedIn’s limited API and lack of CDP style identity resolution mean no single platform sees the full path. The need to manually inspect “How did you hear about us?” fields and reconcile social and ChatGPT driven leads shows that current information systems aren’t fully supporting managers’ decision needs.

Based on this analysis, BlueSnap has clear opportunities to formalize incremental and lift testing and to move toward more data-driven attribution within or alongside HubSpot. It can also strengthen integration and governance around HubSpot and Salesforce so they function more like a unified customer data layer. There is also an opportunity to standardize qualitative fields like “How did you hear about us?” and technology used. These fields could then be used more systematically in reporting and experimentation instead of relying mainly on manual reviews.

Threats include tightening privacy and tracking constraints, loss of detailed user-level tracking data, and continued executive pressure for simple, short-term metrics such as single email “silver bullets” in a B2B environment. In a post acquisition context where leadership expects clear justification for marketing spend, attribution and measurement systems that lag behind channel and device complexity make it more likely that budget will be misallocated and that important upper and mid-funnel activities will be undervalued.

## **Findings**

The following highlights key insights based on the analysis of Bluesnap’s issues and research that supports recommended attribution and data practices.

### *Attribution problems are architectural and governance driven*

Marketing attribution research argues that attribution should be treated as a decision support model with defined stages (for example, purpose and scope, data availability, model-building criteria, validation, use, and updating), and that unclear data and model structures lead to poor decisions (Hosahally & Zaremba, 2023). This directly reflects BlueSnap’s issues where data availability and integration are limited, cross-device journeys are only partially visible, and current models are simple heuristics that are not routinely validated with experiments.

BlueSnap’s fragmented marketing stack and a lack of a unifying data layer show that the core issues are stack design and data governance, not a lack of awareness of attribution concepts.

### *Heuristic models and misclassified traffic under-credit upper-funnel and partner channels*

Research using large collections of user paths shows that last-click and other heuristic models are structurally inaccurate in multi-touch journeys, while relatively simple data-driven models (for example, regression on campaign-level presence indicators) can be more accurate and easy to

interpret (Romero Leguina, et al., 2020). This aligns with BlueSnap’s reliance on first-touch, last-touch and U-shaped views inside HubSpot and the observation that many paid, partner, and CTV assisted journeys are labeled “organic” or “direct.” April’s CTV example where “streaming ads produced a 33% lift in PPC” and “higher engagement in Taboola and LinkedIn” among exposed users despite low direct clicks, shows that view-based and awareness channels can materially influence later conversions, even when heuristic models understate their contribution (A. Grudier, personal communication, Nov 7, 2025).

#### *Cross-device and privacy constraints mirror industry-wide ROI challenges*

Research conducted on cross-device advertising documents data fragmentation across platforms and devices and shows that traditional first-click and last-click models are especially inadequate in cross-device environments with strict privacy regulations such as GDPR (Mehrotra, 2025). This ties directly to April’s description of users moving between phone, laptop and tablet, as well as Google and direct traffic that hide the true first influence (A. Grudier, personal communication, Nov 7, 2025). GDPR related cookie limits also make tracking in global markets harder (A. Grudier, personal communication, Nov 7, 2025). BlueSnap’s difficulty in seeing what led someone to type “bluesnap.com” or search the brand is a concrete example of these industry wide challenges.

#### *Qualitative and experimental signals exist but are not a formal system*

Attribution frameworks emphasize that models should include clear validation and updating steps, often using field experiments and lift tests, and that qualitative context fields (such as source, technology, and pain point) should be treated as key elements in the data model (Hosahally & Zaremba, 2023). Bluesnap already has elements of this. The team manually reviews “How did you hear about us?” fields, which revealed ChatGPT, LinkedIn, partners, and PR as hidden sources (A. Grudier, personal communication, Nov 7, 2025). They use structured KPI templates, showing leads, net leads, MQL, SQL, opportunities and wins by channel (see Appendix D). This example highlights the type of trends the marketing team focuses on, but the results represented are not real. They have run tests with MNTN that measured lift in PPC, Taboola and LinkedIn for CTV-exposed audiences (A. Grudier, personal communication, Nov 7, 2025). However, these practices are informal and manual rather than integrated into a systematic process and procedure that would lead to a repeatable measurement program.

#### *Data-driven attribution and unified data layers fit BlueSnap’s assets and constraints*

Evidence from digital marketing attribution research indicates that data-driven models using a limited number of recent touchpoints and campaign-level presence indicators can provide more accurate and interpretable decision support than pure heuristic models, especially in B2B journeys (Romero Leguina, et al., 2020). Further research suggests that modeling roughly the last 12 touch points is sufficient for high accuracy, that campaign-level granularity outperforms channel-level views, and that presence indicators work better than raw counts of touchpoints

(Romero Leguina, et al., 2020). This aligns with Bluesnap’s need to move beyond simple first and last-touch models and use its existing campaign level data in HubSpot and Salesforce to build an interpretable multi-touch model suited for executive decision-making. While Bluesnap currently uses multi-touch views in both HubSpot and MNTN and considers several interactions per user, the exact number of touchpoints each platform includes in its path calculations is not specified in the materials provided by April. Work on marketing automation also stresses that modern stacks depend on tightly integrated marketing automation platforms and CRMs, often supported by CDPs or unified data layers that reduce silos and support AI driven analytics. (Zatini & Lizzi, 2022; MarTech, 2025).

*Organizational expectations and KPI alignment are as critical as technology*

Research on information systems and marketing automation highlight that advanced automation and analytics must be governed by shared metrics and cross-functional understanding, and that firms invest in information systems to achieve operational excellence, improve decision-making and survival (Zatini & Lizzi, 2022). April’s experience educating executives that B2B is a “long game” with only a small fraction of the target audience in market at any given time, shows the gap between expectations for quick channel-level wins, and the reality of long, multi-touch buying cycles (A. Grudier, personal communication, Nov 7, 2025). BlueSnap’s month-end template already tracks the full funnel from leads and net leads through MQLs, SQLs, opportunities, wins and projected AGM, but the connection between these KPIs and a validated, unified attribution framework remains incomplete. This limits how much confidence business stakeholders have in the reports.

## **Recommendations**

Before selecting the proposed phase approach, three broad options for improving attribution and marketing decision-making at Bluesnap were considered and compared on implementation effort, cost, data quality and organizational fit.

*Option A: Maintain the current approach*

Implementation effort is minimal and there is no additional cost because BlueSnap would continue to rely primarily on first-touch and last-touch reporting, ad platform metrics and informal qualitative input. However, data quality remains limited since ChatGPT/LLM, partner, PR, and upper-funnel influence stay under-measured. Organizational fit with a complex B2B funnel is weak because leadership debates would continue to be based on incomplete views of incremental impact.

*Option B: Purchase a ready to use attribution platform as the primary solution*

Implementation effort and cost are both high as BlueSnap would need to license, integrate and adopt a third-party attribution or Marketing Mix Modeling (MMM) platform. Data quality could improve if the vendor models are well implemented but organizational fit is uncertain. BlueSnap

would first need to fix the Urchin Tracking Module (UTM) discipline fields and HubSpot/Salesforce alignment. There also is a risk that the platform would process fragmented data and internal teams may not fully understand or trust the outputs.

*Option C: Build a phased, internally owned attribution framework on existing systems*

Implementation effort and cost are moderate because the plan relies on strengthening data foundations, adding structured qualitative fields, piloting data-driven models and running targeted lift tests using existing tools such as HubSpot, Salesforce and current reporting platforms. Data quality improves substantially as governance, experiments and modeling are layered in. The organizational fit is strong because marketing, operations, channel owners, sales, finance and leadership all have clear roles and build shared understanding of the metrics used to guide budget and channel decisions.

Comparing across these criteria, Option C offers the best balance for Bluesnap. It improves data quality and decision-making without the cost and risk of a large vendor implementation. It fits the organization size and B2B go-to-market model while remaining realistic for a six person marketing team.

The following recommendations are made:

**Recommendation 1:** Strengthen data integration and build a “virtual CDP” around HubSpot and Salesforce

BlueSnap should use the systems it already has and treat HubSpot and Salesforce together as the core of a virtual customer data platform (CDP) by standardizing identifiers, fields, and tracking across systems. This includes agreeing on a common structure and definitions for key fields, such as original source, latest source, campaign, channel, partner, “How did you hear about us?”, and technology used, and making sure these fields stay in sync between HubSpot and Salesforce the existing integration. It also means standardizing UTM and campaign conventions, and ensuring all paid partner, PR and content links are tagged in the same way. This recommendation is feasible for a six person marketing team because it mainly requires configuration, governance and process changes inside the current tools, rather than buying and implementing a brand new platform. The main obstacles are limited operations and analytics capacity to redesign fields and sync rules, messy historical data that needs cleanup, and potential resistance from the sales team and others to changing established naming conventions or processes tied to current fields. If executed, the expected benefits are improved data consistency, reduced manual reporting effort, a stronger attribution foundation and clearer executive visibility into lead and opportunity sources.

**Recommendation 2:** Move beyond heuristic models to a simple, data-driven multi-touch attribution model

BlueSnap can implement a linear regression based on an attribution model using its own data. This means exploring user paths at the campaign level from HubSpot and Salesforce, marking whether each campaign appeared in roughly the last 12 points as yes/no (binary) indicators, and then fitting a regression model to predict whether a contact converts or creates an opportunity. The resulting numbers from the model can be interpreted as contribution weights for campaigns, and can sit alongside the existing first-touch, last-touch, and U-shaped views, rather than replacing them. This approach is supported by the research in “Digital marketing attribution: understanding the user path” (Romero Leguina et al., 2020), in which the author showed that simple regression models on campaign level paths can outperform pure first or last-click rules and is realistic and feasible for Bluesnap because it uses current tools and needs solid analytical skills, but not a large, specialized team. A small analytics team or advanced analyst is sufficient. The main obstacles are limited internal time and expertise to extract and prepare the path data, incomplete paths caused by cross-device behavior and privacy limits that affect model quality, and potential skepticism from stakeholders if the new model’s results do not match the familiar first and last-touch reports. If implemented, the expected benefits are fairer credit assignment, clear executive-level insights and stronger guidance for budget reallocation toward revenue driving campaigns.

**Recommendation 3:** Formalize, qualitative, attribution fields and incorporate ChatGPT and partner sources

BlueSnap should organize and consistently manage its qualitative attribution data by turning free text “How did you hear about us?” responses into picklists or predefined answer options with choices such as ChatGPT/LLM, LinkedIn ad, LinkedIn organic, PR, specific partners, events, and “other”, while still keeping a separate text field for extra detail when needed. These structured fields should be required on key web forms and recorded during sales calls where possible, and then included in reporting dashboards alongside quantitative metrics such as lead quality, dismissal rate, and contribution to new opportunities. This recommendation is feasible because it mainly involves changing form fields and report definitions in HubSpot and Salesforce, rather than adding new technology. The main challenges are getting the sales team to consistently record the structured information, designing the list of answer options so it’s specific enough to be useful, but not too long that people avoid using it, and deciding how to translate older free text responses into the new standardized categories. If put into place, the expected benefits include scalable measurement of non-click based demand, clearer attribution of “direct” and “organic” leads, and stronger executive understanding of the value beyond last-click attribution.

**Recommendation 4:** Introduce a structured program of incremental and lift testing

Bluesnap should standardize lift and incrementality tests for priority channels, such as CTV, display, and LinkedIn. Simple geo or audience-level experiments can be designed in collaboration with ad platforms, where some regions or segments are exposed to specific campaigns, and others are held out, and differences in site visits, qualified leads, and opportunities are measured. These experiments can be repeated periodically and used to refine both heuristic and data-driven attribution models, rather than relying solely on observed click paths. This recommendation is feasible if it is limited to a small number of high-impact channels and experiments are designed simply, building on the CTV test BlueSnap already has run. The main obstacles are the need for coordination with platforms such as MNTN and LinkedIn to set up control groups, or geo tests, the short-term willingness to reduce spend or hold out audiences in order to measure incremental impact, and limited analytical capacity to design tests and interpret results correctly. If implemented, the expected benefits include clearer insight into incremental lift by channel and campaign, stronger attribution validation and more defensible budget decisions.

**Recommendation 5:** Align KPIs and dashboards with long-term value and B2B realities BlueSnap’s reporting should expand beyond surface-level first and last-touch source and lead counts to include metrics that reflect lead quality, assist value, and long-term value. This includes tracking dismissal rate by source and channel, CAC-to-CLV ratios by acquisition route, payback period, incremental pipeline and revenue attributed to key channels, and the share of opportunities influenced by upper funnel campaigns such as CTV, PR, partners, and ChatGPT discoverable content. Dashboards should be built collaboratively with marketing, sales, operations, and finance and reviewed regularly so that everyone is working from the same definitions of performance. This recommendation is feasible because it builds on the KPI structure and dashboards Bluesnap already uses by enhancing them instead of replacing them. The main obstacles are executive habits of focusing on short term metrics like raw leads or last-click CPA (Cost Per Acquisition), the effort required to add and maintain new metrics, the effort needed to add and maintain information or informative metrics with good data quality, and the need for change management so sales, finance and leadership interpret the new dashboards consistently. If implemented, the expected benefits include dashboards that reflect the true B2B funnel, cross-functional alignment on performance by channel and cleaner, attribution aware investment decisions.

### **Implementation Plan:**

Implementation of these recommendations can follow three phases roughly over 6 to 12 months.

#### *Phase 1 (0-3 months): Focus on data foundations and governance*

The marketing operations lead, working with operations or sales and light analytic support with standardized UTM and campaign naming conventions, align core fields in HubSpot and Salesforce (such as original source, latest source, campaign, partner, “How did you hear about

us?”, and technology used), and update forms and lead objects to capture structured values and dismissal reasons. Using the existing month and KPI template as a starting point, they would set up basic data quality checks and a simple dashboard to monitor source consistency and dismissal rates. With a six person marketing team and no separate analytics group this phase deliberately focuses on improving the reliability of current systems rather than adding new platforms.

*Phase 2 (3-6 months): Pilot data-driven modeling and lift tests*

Once core fields and tracking are more consistent, a member of the marketing team with strong analytical skills would export historical and campaign level interaction data from HubSpot and Salesforce and build an initial data-driven multi-touch model. For example, a regression model that uses campaign presence indicators over the last 10-12 touch points to predict conversions or opportunity creation. The team would compare this model’s results to existing first-touch, last-touch and U-shaped views for a small set of priority campaigns. They should look for patterns and discrepancies that help explain current channel performance. At the same time, channel owners for paid search, paid social, display, and CTV would work with marketing to design and launch at least one structured lift test for a major channel. Such as Geo or audience level control group tests for CTV or LinkedIn, to generate evidence about incremental impact.

*Phase 3 (6-12 months): Scale and align the organization*

If the initial model and experiments prove useful, BlueSnap would move to a regular model refresh, for example, quarterly as new data accumulates. They should then gradually expand experiments to additional channels where there is meaningful spend. Marketing operations and analytic support would integrate the new attribution outputs and lift results into executive dashboards alongside existing funnel KPIs. April and channel owners would formalize a monthly or quarterly review in which they use these reports to decide where to increase or reduce spend, and which test to run next. This would turn what is currently an informal discussion into a structured decision-making process. If capacity becomes a constraint, BlueSnap could bring in external partners to help with modeling or data engineering, while keeping the overall approach and key decisions owned by the existing marketing and operations teams.

## **Conclusion**

BlueSnap’s core challenge is that its current information systems and attribution methods cannot reliably show which marketing activities truly drive high quality, opportunities and revenue. Despite running sophisticated multichannel campaigns and tracking a detailed campaign level data set of KPIs. This matters to decision makers because it directly affects how budget is allocated, how CAC and ROI by channel are reported, and how confidently leadership can defend or adjust investments in brand, partners, CTV and AI discoverability.

By strengthening data foundations in HubSpot and Salesforce, moving beyond simple first and last-touch models toward data-driven attribution and structured lift tests, and aligning dashboards

with B2B realities and long-term outcomes, BlueSnap's leaders can turn marketing attribution from a fragmented reporting task into a reliable decision support system for channel mix, partner, strategy, and growth investments.
